#NYUTandon in the News: 11/14/24

Herman F. Mark Professor [Elisa Riedo](#) (CBE) discusses her pioneering work in thermal scanning probe lithography, which uses a heated "magic pen" to create 3D nanoscale structures and is now commercialized as the NanoFrazor. "You can use your pen like a scalpel... with almost atomic scale precision, you can have your hot pen...create whatever 3D structure that you want," explains Riedo to [The Science Talk](#)'s Under the Microscope. She's now applying this technology to develop medical diagnostic devices.

[The years-long quest to make an 'artificial leaf' as a promising fuel alternative](#)

WHYY The Pulse, November 11, 2024

Associate Professor [Miguel Modestino](#) (CBE), Director of NYU Tandon's Sustainable Engineering Initiative, began his journey at UC Berkeley with an inspiring vision: creating artificial leaves that could turn solar energy into fuel, just as plants do. "The concept of an artificial leaf is beautiful. It's inspiring," he recalls. But as an NYU Tandon faculty member now, he's learned a hard lesson about market realities: "Clean fuels do the same function as dirty fuels... You need to compete on very similar markets, and fuel markets are hyper competitive." Rather than abandon the technology, Modestino adapted—pivoting to use artificial leaf technology to make nylon from solar power and renewable materials, a more economically viable application that could still help reduce dependence on fossil fuels.

[Precision at the Nanoscale: 3D Sculpting with NanoFrazor ft. Elisa Riedo](#)

The Science Talk's Under the Microscope, November 7, 2024

Hi all, I'm Elliott, an R&D engineer at Heidelberg Instruments Nano, the team behind the [NanoFrazor](#)! I'm excited to be curating this page today and to share some impressive work from Prof. Riedo's group. Here is my own nanoseal, stay tuned for a demo of how we create these 🧐
